# Retina: Window to the Brain

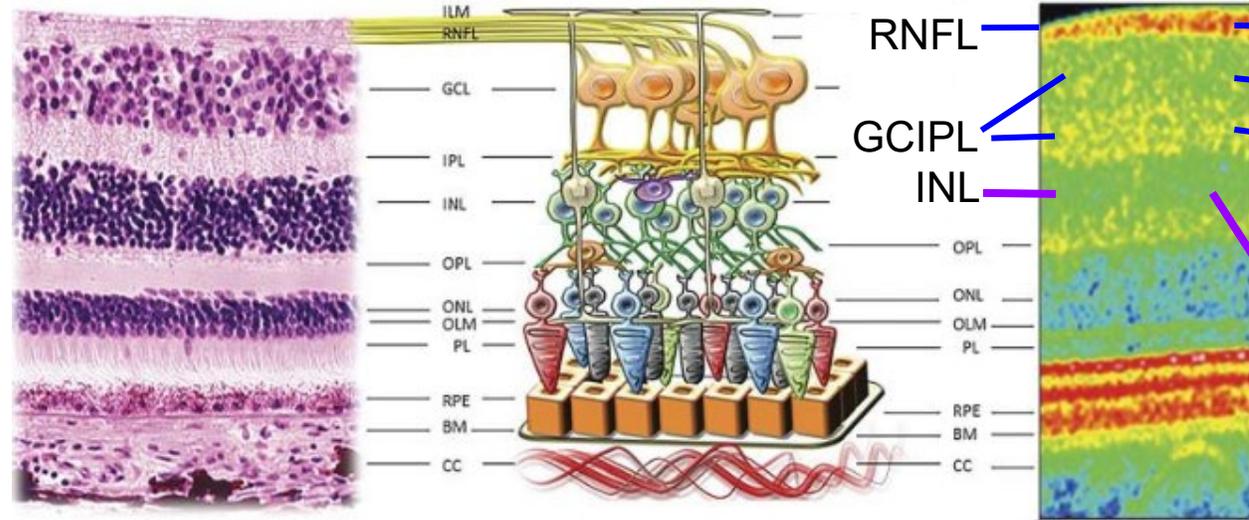

## Retina: Most accessible CNS extension

- *Similarities: anatomy, function, response to insult, immunology*
- Major neurodegenerative disorders reflected in the retina
- Technical advances in ocular imaging / function
- Convenient platform to study CNS diseases and therapies

# Optical Coherence Tomography

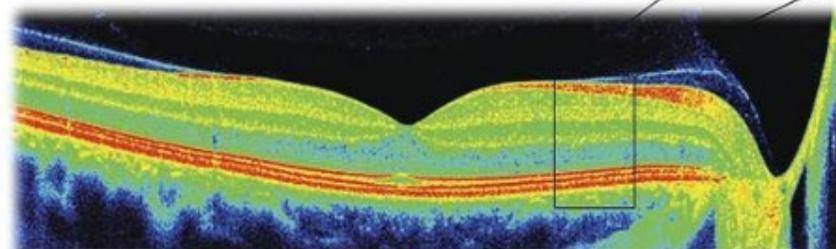

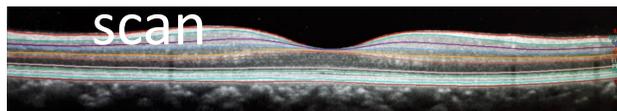

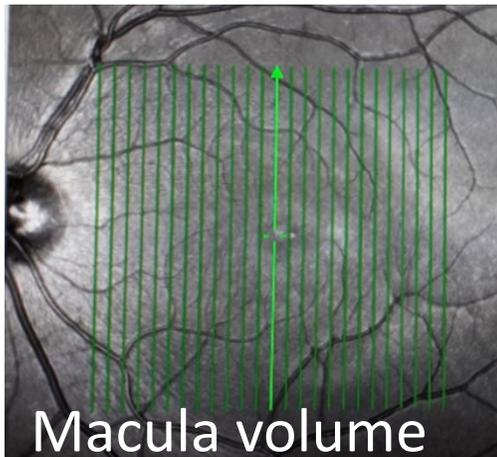

- Principle: equivalent to ultrasound.
- Thickness of the layers can be quantified as axonal/neuronal/dendritic loss

ganglion cell axon  
ganglion cell body &  
dendrite (synapses)

*Petzold et al., 2017*

bipolar, horizontal,  
amacrine cells

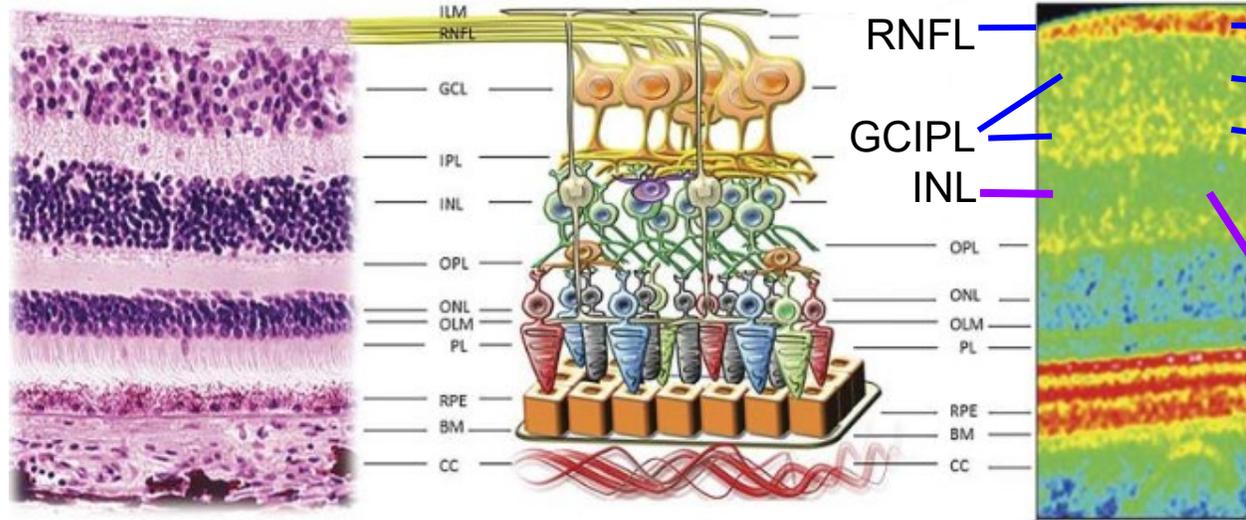

*Balk et al., 2019*

RNFL = retinal nerve fiber layer; GCL = ganglion cell layer;  
IPL = inner plexiform layer; INL = inner nuclear layer;

# Subject Demographic

	Healthy (N = 30)	PPMS (N = 17)	SPMS (N = 20)
Gender (M/F)	9/21	13/4	8/12
Age (y)	32,2 ± 9,8	45,6 ± 11,1	47,5 ± 7,2
Disease Duration (y)	-	2,7 ± 1,0	14,0 ± 8,8
Progression duration (y)	-	2,7 ± 1,0	1,7 ± 1,4
EDSS	-	4,6 ± 0,9	5,3 ± 1,3
Eyes with ON (N))	-	5	10
Global pRNFL thickness(μm)	98,7 ± 9,1	94,4 ± 10,1	90,2 ± 8,4

- people with **newly-confirmed** progressive MS consecutively enrolled from fall 2015 to summer 2018 (PPMS: primary progressive MS; SPMS: secondary progressive MS)
- Left and right eyes were averaged (in case of no history of ON in both eyes)
- Only Eyes **without history of optic neuritis** (ON) and **with normal global peripapillary RNFL** (pRNFL) thickness were used.

# Discussion

- In PPMS, the amplitude was correlated with:
  - Positive correlation with GCIPL
  - Negative correlation with INL
- Smaller amplitude: more axonal loss
- Thinner GCIPL: more neuronal/dendritic loss
- Thicker INL: higher inflammation
- The results suggest that the integrity of axons within the optic radiation is correlated with the neuronal/dendritic loss and inflammatory in the retina

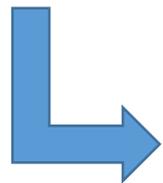

***Trans-synaptic retrograde degeneration?***

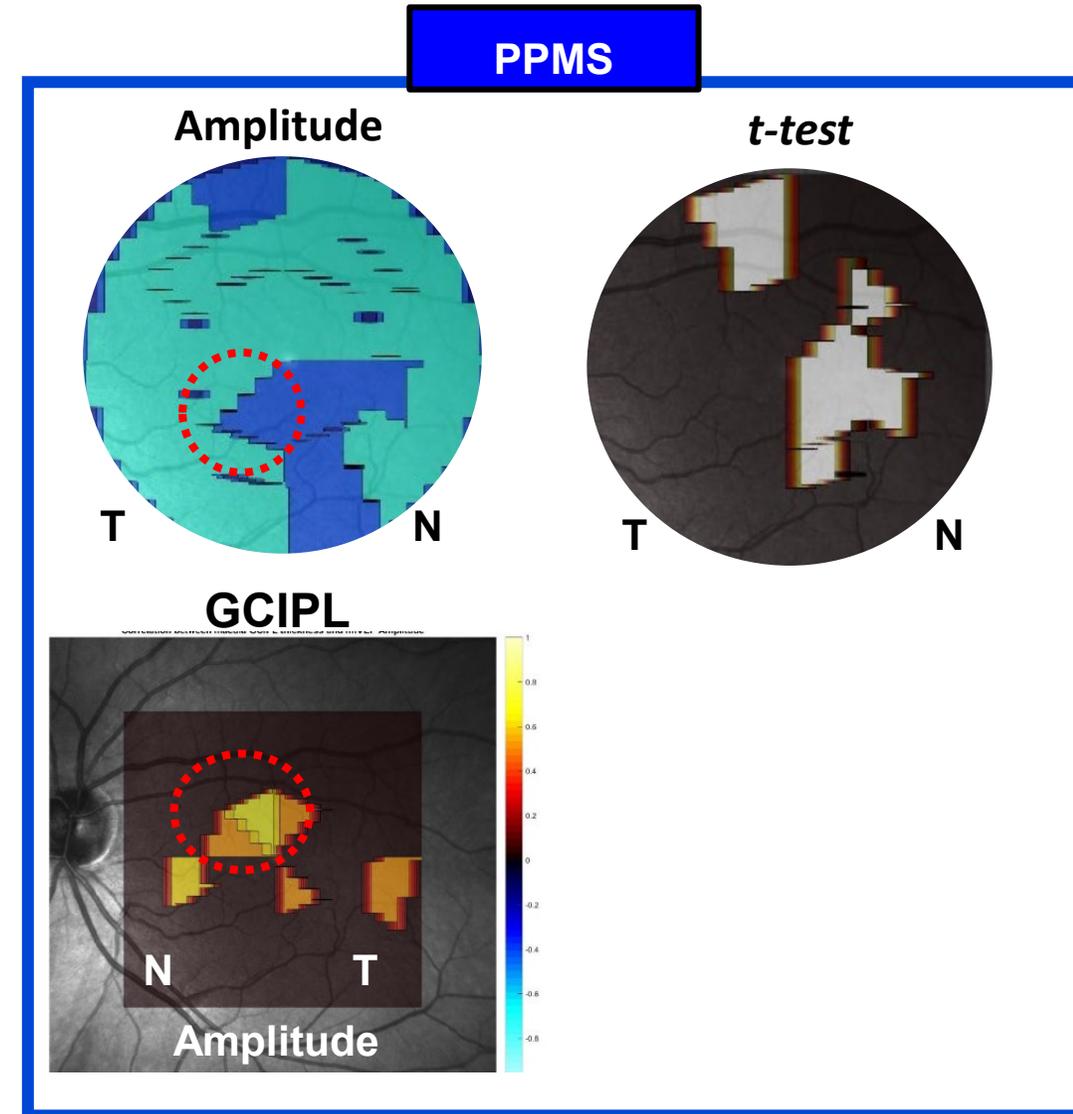

# Discussion

- In PPMS, the amplitude was correlated with:
  - Positive correlation with GCIPL
  - Negative correlation with INL
- Smaller amplitude: more axonal loss
- Thinner GCIPL: more neuronal/dendritic loss
- Thicker INL: higher inflammation
- The results suggest that the integrity of axons within the optic radiation is correlated with the neuronal/dendritic loss and inflammatory in the retina

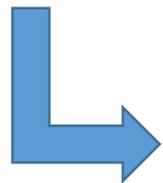

***Trans-synaptic retrograde degeneration?***

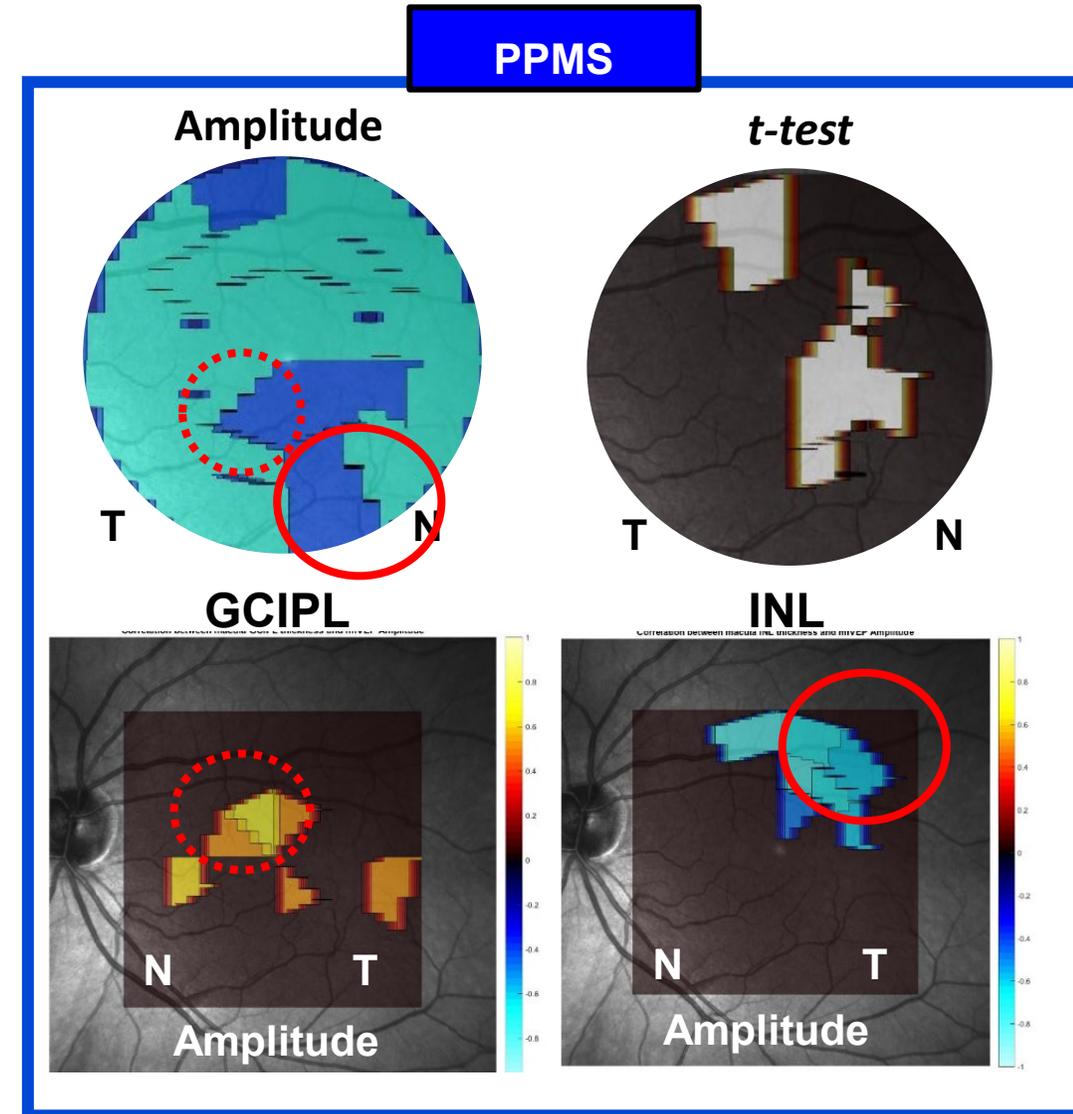

# Discussion

- In PPMS, the amplitude was correlated with:
  - Positive correlation with GCIPL
  - Negative correlation with INL
- Smaller amplitude: more axonal loss
- Thinner GCIPL: more neuronal/dendritic loss
- Thicker INL: higher inflammation
- The results suggest that the integrity of axons within the optic radiation is correlated with the neuronal/dendritic loss and inflammatory in the retina

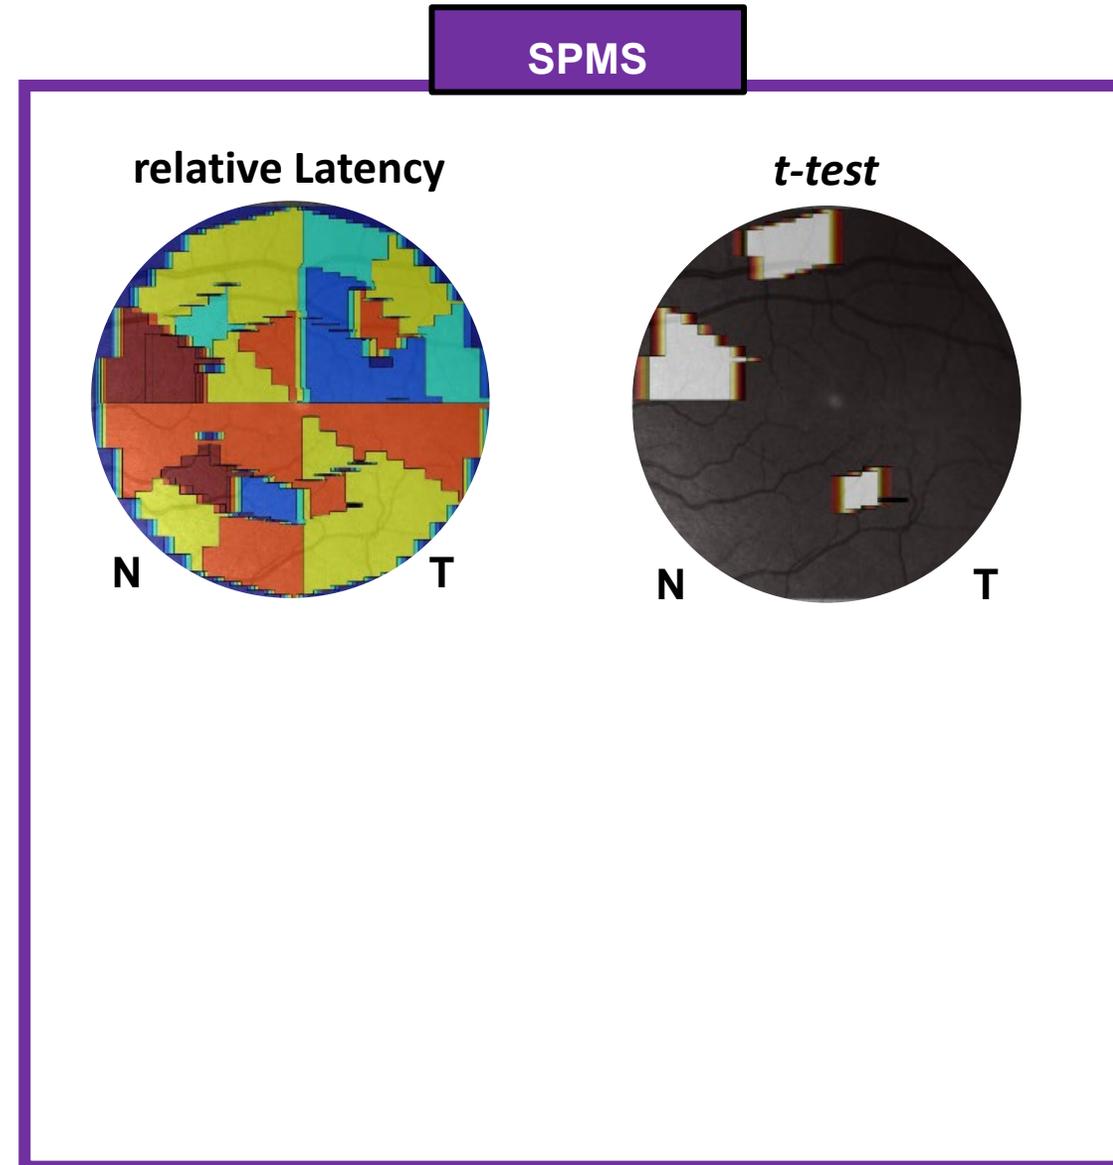

***Trans-synaptic retrograde degeneration?***

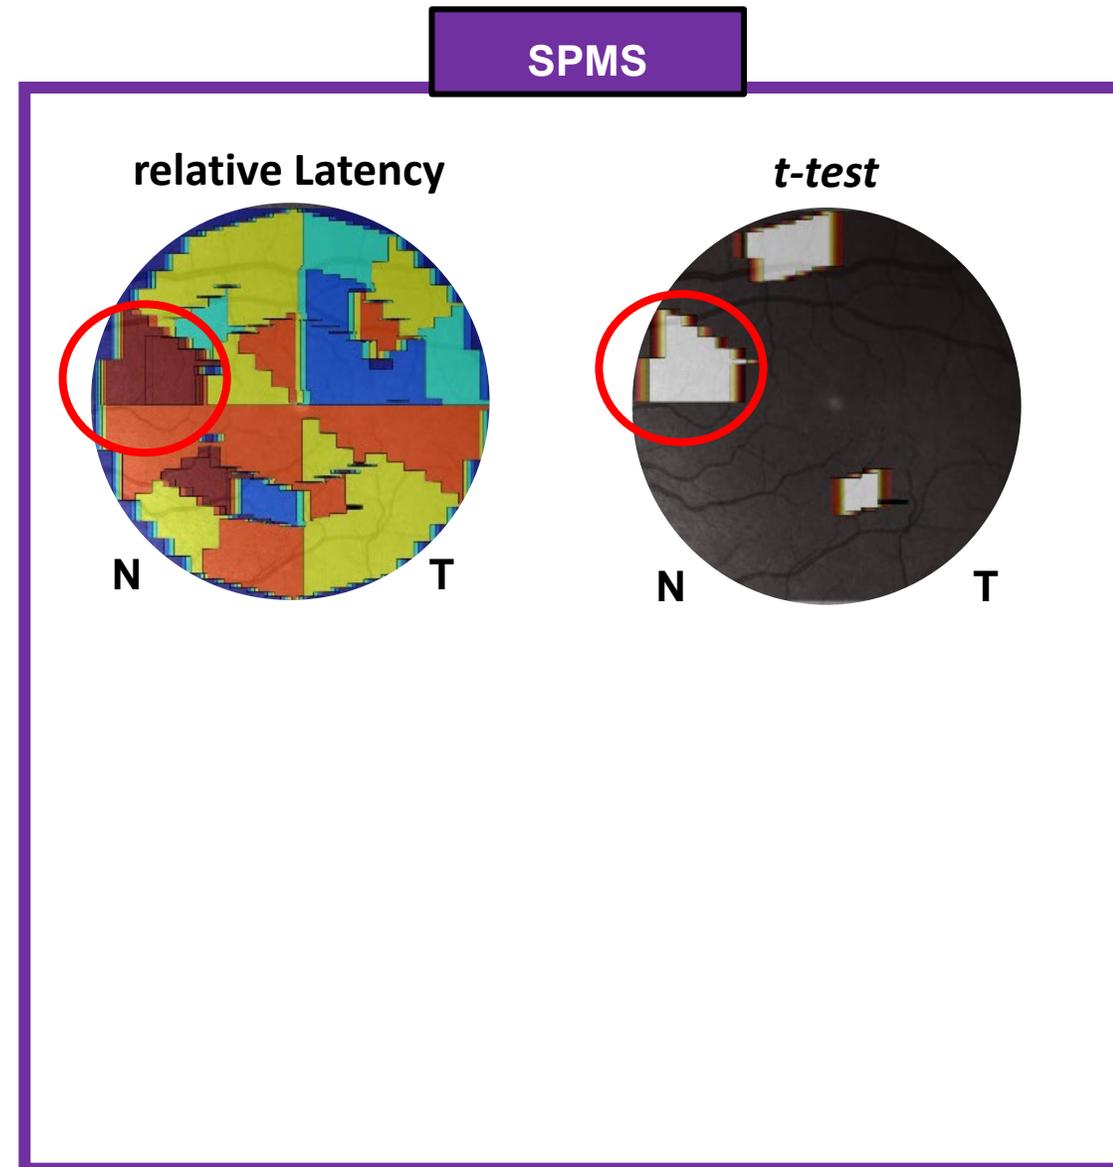

# Discussion

- In SPMS, the latency was negatively correlated with GCIPL thickness, especially the IPL thickness, while almost no significant GCIPL atrophy was found.
- Longer latency, which reflects demyelination, has been reported to be an early sign of neurodegeneration. *You et al., 2019*
- IPL thinning suggests dendritic atrophy, which is also an early sign of neuronal death. *Merten et al., 2020*
- This correlation may be an sign of the trans-synaptic degeneration among the visual pathway

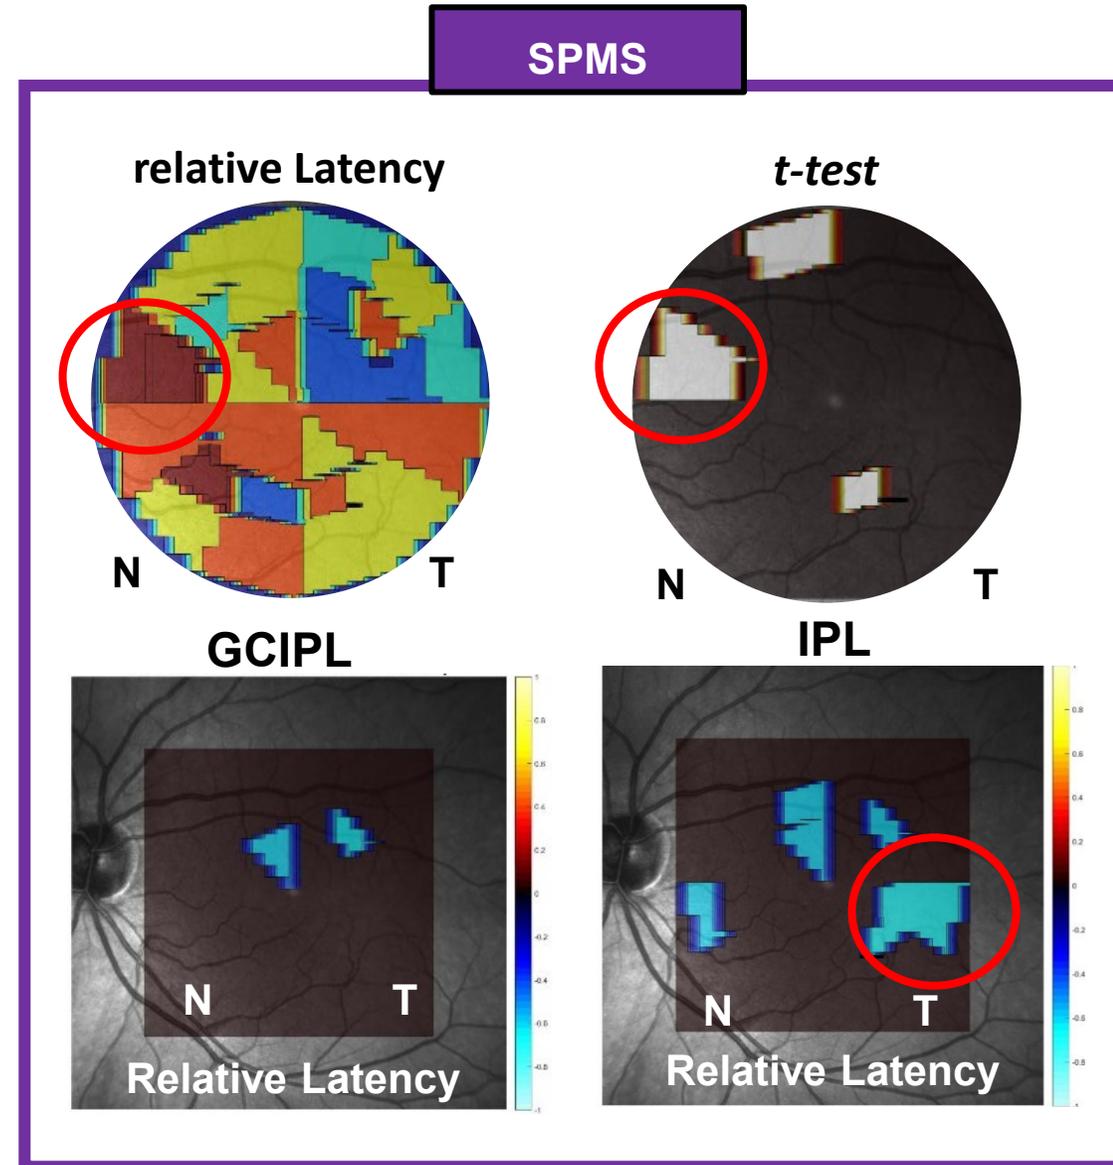

# Discussion

- In SPMS, the latency was negatively correlated with GCIPL thickness, especially the IPL thickness, while almost no significant GCIPL atrophy was found.
- Longer latency, which reflects demyelination, has been reported to be an early sign of neurodegeneration. [You et al., 2019](#)
- IPL thinning suggests dendritic atrophy, which is also an early sign of neuronal death. [Merten et al., 2020](#)
- This correlation may be an sign of the trans-synaptic degeneration among the visual pathway

# Discussion

- In SPMS, the latency was negatively correlated with GCIPL thickness, especially the IPL thickness, while almost no significant GCIPL atrophy was found.
- Longer latency, which reflects demyelination, has been reported to be an early sign of neurodegeneration. [You et al., 2019](#)
- IPL thinning suggests dendritic atrophy, which is also an early sign of neuronal death. [Merten et al., 2020](#)
- This correlation may be an sign of the trans-synaptic degeneration among the visual pathway

# Conclusion

- The sector-to-channel correlation between OCT and mfVEP provides a tool to study the relationship and propagation of inflammation/demyelination and neurodegeneration *in vivo*.
  - In PPMS, correlation was found between mfVEP amplitude and OCT parameters(GCIPL and INL). A hint of ongoing inflammation in optic radiation resulted in retrograde degeneration in the retina?
  - In SPMS, IPL seems to be the early responder to the process of trans-synaptic neurodegeneration
- Future direction
  - Bigger sample size to confirm the current observation
  - Correlate with other modalities and clinical features to better explain the results
    - MRI
    - Cognitive state
    - EDSS
    - Visual function
    - Motor function
    - Biopsy/post-mortem study
